Our company is now handling the Mauget line of micro tree injection products. Included in the product line are insecticides, fungicides, fertilizers and others. Usage of these products has proven to be very cost-effective compared to other methods of disease and insect suppression. They aren't designed to replace all spraying, but have been proven effective for a good tree maintenance program.

The chemicals are introduced directly into the sap wood of the tree thereby making them environmentally acceptable. They cause no air pollution and no harm to beneficial insects. They go into the tree, not all over the neighborhood. And wind and rain conditions do not impede treatment times.

These chemicals are for use on problems such as those listed below:

Insecticides

Bronze Birch Borers
Various scale insects
Aphids
Numerous worms
Leaf beetles
Leaf miners

Fungicides

Cytospora canker on
Spruce
Cankers on numerous
deciduous trees
Anthracnose
Dutch Elm Disease
prevention

Fertilizers

Trees under stress
from restricted
root zones, insect
attacks, construc-
tion sites, poor
soil conditions

Although not all problems can be listed here, it is possible to suppress many other insect and disease problems with these products.
